We examined features of zooplankton within wetlands of Rivnenskyi Nature Reserve. Totally we found 50 species of zooplankton. Among them the most dominated were cladocera – 23 species (46%), 9 species of copepods (18%) and 8 species of rotifers (16%). The average value of Shannon index is $2,3 \pm 0,2$. We also presented ecological characteristics of these species. We didn't found the classic ratio between ecological forms of zooplankton, when phytoplankton forms predominate over others, because of different types of researched waters. We determined that every researched water ecosystem has specific species composition of zooplankton.

Keywords: zooplankton, wetlands, marsh, Rivnenskyi Nature Reserve.
